"Correlation Between Internal Differential Quantum Yield of Generation and Wear Field Picture of Injection Lasers"

Minsk, Zhurnal Prikladnoy Spektroskopii, Vol 14, No 3, Mar 71, pp 531-533

Abstract: The correlation of the near field picture with the differential internal quantum generation yield is experimentally established. In diodes made of the same material and having the same dimensions the more homogeneous the near field picture, the greater the quantum yield of generation. Tests were performed with a series of 22 GaAs diffusion diodes at liquid nitrogen temperature with generation excited by pulses of current 1 µsec in length with a pulse repeition frequency of 60 Hz.

"Concerning the Mechanism of Thermal and Thermomechanical Methods of Rock Destruction"

Nauch. tr. Kazakhsk. politekhn. in-t (Scientific Works. Kazakh Polytechnical Institute), Alma-Ata, 1971, pp 392-396 (from RZh-Mekhanika, No 5, May 72, Abstract No 5V586)

Translation: It is noted that solid rocks are intensively destroyed by a heat flux (jet). In porous rocks with a strongly developed crack structure, destruction by the thermal method takes place slowly and unsteadily. In this case, combined heat and mechanical action on the rock is recommended. Indentation of a flat punch into a rock preheated by a flux is considered. Stresses in this case are determined as the sum of the stresses due to the heat alone and to the external load in the absence of heating. The paper presents the results of calculation of the pressure on the punch as a function of the heat flux for granite and teschenite. The products of thermomechanical destruction are particles with a size of the order of 0.1 cm. It is noted that there exists a definite relation between the thermal action,

"Mechanism of Thermal Destruction of Rocks Under Conditions of Brittle Splitting"

Nauch. tr. Kazakhsk. politekhn. in-t (Scientific Works. Kazakh Polytechnical Institute), Alma-Ata, 1971, pp 382-391 (from RZh-Mekhanika, No 5, May 72, Abstract No 5V585)

Translation: The authors calculate destruction of rocks with various physicomechanical and thermophysical properties under the effect of heat flux from a jet. Splitting stresses resulting in cracks parallel to the free surface arise at the point of action of the flux as a consequence of the difference in temperatures of the surface and deep-lying layers. The plate of rock over the crack is clamped around the perimeter. A bending moment is developed during thermal expansion. The relation between splitting and normal stresses is determined as well as the condition of crack formation and cleavage of the plate. The resultant equations are recommended for setting the minimum heat flux sufficient for splitting rock. G. M. Lyakhov.

"Heat Resistance of Nickel-Base Weld Seams"

Moscow, Fizika i Khimiya Obrabotki Materialov, No 4, Jul-Aug 71, pp 117-123

Abstract: Data on the effect of molybdenum and tungsten on the heat resistance of nickel-base weld seams, suitable for long-time service at high temperatures, are absent in the literature, and for this reason the present investigation is devoted to determination of the optimum quantities of alloying elements from the view-point of long-time heat resistance and engineering strength of a nickel-base weld seam. Thirteen compositions, containing a varying amount of Mo (from 7 to 22%), including the compositions of INET-10 and TsT-28 electrodes, were studied as well as compositions in which the niobium content changed from 1 to 1.7%. The welded metals were given the following designations: Khi5M6OM7, Khi5M65M14V4 (TsT-28), Khi5M65M18, Khi0M65M22 (INET-10), Khi3M5OB, Khi5M7OB2, Khi5MB2, MZhO, MZh2, HZh3, MZh4, MZh5, MZh8, Zh3, Zh6, and Zh8.

A nickel-base sear metal with added Mo possesses higher strength and better long-time strength than when alloyed with niobium. Optimum concen1/2

trations of Mo in the seam metal of the Ni-Cr-Mo system with 10-15% Cr were 12-14%, which corresponds to its greatest solubility in the matrix. Cause of embrittlement and lowering of long-time strength of the seam metal alloyed with Mo is precipitation of the rich molybdenum mu-phase; intensive formation of this phase is observed in the presence of iron and silicon and for molybdenum in amounts exceeding the limit of its solubility in the matrix. The mechanism of appearance of hot welding cracks in seams alloyed with Mo in quantities of the lowest limit of its solubility and significantly exceeding this quantity and limit were different. "Effects of the Ionic Strength and Organic Solvents on the Interaction of Cholinesterases with Substrates and Organophosphorus Inhibitors"

Moscow, Biokhimiya, Vol 35, No 2, Mar-Apr 70, pp 362-393

Abstract: The effect of various concentrations of KC1 on the reactivity of acetylcholinesterase (A) from bovine erythrocytes and butyrylcholinesterase (B) from equine blood serum with respect to two substrates, acetylcholine and phenyl acetate, and two organophosphorus inhibitors, $C_2H_5(CH_3)P(0)SC_2H_1SC_2H_5$ (G1-7) and $C_2H_5(CH_3)P(0)SC_2H_1SC_2H_5$ (G1-7) and centrations of KC1, the reactivity of A and B decreased towards the cationic substrate acetylcholine and Gd-42 because of a decrease in the Coulomb interaction with the anionic center of the enzymes, whereas it increased towards the non-cationic substrate PhOAc and Gd-7 because of an increase in hydrophobic interaction with the hydrophobic sections of the active surface of the enzymes. In the acidic

1/3

USSR

BRESTKIN, A. P., et al, Biokhimiya, Vol 35, No 2, Mar-Apr 70, pp 382-393

pH range, in which ionization of the anionic center was depressed, the inhibiting effect of KC1 on the rate of the reaction of A and B with Gd-42 was less pronounced. Changes in the effect of the ionic strength at pH 5.5-8.2 on the inhibiting action of Gd-42 towards A and B made it possible to estimate the pK of the anionic center of A and B at 6.1 and 6.8, respectively. The effects of C2H5OH, C3H7OH, iso-C3H7OH, CLH90H, iso-CLH90H, sec-CLH90H, and tert-CLH90H on the anticholinesterase activity of organophosphorus inhibitors C2H5O(CH3)P(O)S(CH2)nC(CH3)3 (series LG) and $^{\rm C}_{\rm 2^{\rm H}2n+1}^{\rm O(CH_3)P(0)SC_{\rm L}^{\rm H}_{\rm 9}}$ (series GA) were studied in experiments with B. The alcohols reduced the anticholinesterase activity of the organophosphorus compounds by worsening their hydrophobic interaction with the non-polar sections of B and also by altering the structure of these sections. The hydrophobic section in the region of the esterase center of B was more resistant to the action of alcohols than that in the region of the anionic center. The maximum effect in reducing the activity in the series LG was produced by iso- $C_{l_1}H_{0}OH$, to which hydrophobic regions in the region of the anionic center are particularly sensitive, while the maximum

"The Effect of the Geometry of Growth of a-Sn Crystals on the Kinetics of Transformation of White Tin Into Gray"

Kiev, Metallofizika, No 32, 1970, pp 113-118

Translation: The general kinetics of the β + α transformation of the highpurity OVCh-000 (99.9995%) tin on specimens of various forms, i.e., massive in the form of small cubes, plates, and wire, was investigated by the method of hydrostatic weighing.

The overall rate of the polymorphic $\infty \rightarrow \alpha$ transformation adheres to Avrami's equation

 $X = 1 - \exp(-At^k),$

where X is the share of the transformed volume; A and k are the constants. At the same time, k depending on the form of specimens assumes various values: 2.3-2.7 for massive specimens, 1.5-2 for specimens in the form of plates, and 1 for the specimens in the form of wire of a diameter less than 0.8 mm.

"The 'Quasidiagonal' Problem of Quadratic Integer Programming"

Moscow, Mat. metody resheniya ekon. zadach--sbornik (Mathematical Methods of Solving Economics Problems--collection of works), No 3, "Nauka", 1972, pp 137-145 (from RZh-Kibernetika, No 5, May 73, abstract No 5V655 by Yu. Finkel'shteyn)

 ${f Translation:}$ The paper discusses the problem of minimizing the quadratic form on an integer lattice

$$f(n) = (\widetilde{n} - n)^T \Phi(\widetilde{n} - n) + \min. \tag{1}$$

Here $\Phi = (\Phi_{ii})$, $i, j=1, \ldots, p$, is a given positive definite symmetric matrix; $\bar{n} = (\bar{n}_i), i=1, \ldots, p$ is a given vector of coefficients, which in the general case are integers; $n = (n_i), i=1, \ldots, p$ is the sought integer vector, $n_i = 0, 1, 2, \ldots$. An example is given of economic interpretation of the given problem. Three methods of minimizing quadratic form (1) are considered, the first of which is based on the principle of dynamic programming, the second — on using the properties of local minima, and the third is a combination

"An Attempt to Define the Distribution of Tularemia in Northern Rayons of Tyumenskaya Oblast"

V sb. Probl. osobo opasn. infektsiy (Problems of Especially Dangerous Infections -- collection of works) Vyp. 5(15). Saratov, 1970, pp 173-181 (from RZh-Meditsinskaya Geografiya, No 4, Apr 71, Abstract No 4.36.97)

Translation: Zoological, parasitological, bacteriological, and epidemiological research conducted during 1967 field trips provide evidence about the wide distribution of tularemia in the northern rayons of Tyumenskaya Oblast, all the way to shore areas of the mouth of the Ob River, the foothills of the polar Urals, and the Pur River basin. According to the high percentage of natural immunity among the local population, one can judge the significant level of epidemiological activity of the foci. A discussion is presented of the reasons for the non-correlation of skin allergy test results with tularemia incidence, and the reaction of agglutination with blood serum in the population of the North. Tularemia was first established among reindeer.

"The Lytic Effect of Sodium Desoxycholate on Tularemia Pathogens"

Moscow, Zhurnal Mikrobiologii Epidemiologii i Immunobiologii, No 5, May 71, pp 141-143

Abstract: The ability of 0.05-1% sodium desoxycholate solutions to lyse various tularemia pathogens was investigated — Gayskiy's vaccine strain No 15, the virulent American Schu and BH-8859 strains, strain No 777 (200 passages), and the nonvirulent strain No 32/400. Changes in the optical density of the culture suspension (which occurred after addition of 1 ml of the reagent to 1 ml of the suspension) served as the index of lysis. Sodium desoxycholate concentrations of 0.05% and 0.25% yielded minimum and maximum clearance of optical density. However, destruction of cells was never complete, because the clear liquid gave rise to culture growth on agar. The antigen released into solution was precipitated by tularemia sera. Evidence indicates that this was the Vi-antigen of F. tularensis, which is absent in nonvirulent strains and which is present in virulent strains in a greater concentration than in vaccine strains. Upon epidermal application to infected rabbits, lysate of virulent and vaccine strains produced allergenic skin reactions.

"Effect of Fiberglass on the Contrast-Frequency Characteristics of Optical Systems"

Leningrad, Optika i Spektroskopiya, Vol XXXIV, No 4, 1973, pp 789-791

Abstract: The quality of the image formed by an optical system is determined by its contrast-frequencyccharacteristic or the contrast transmission function T(N). If during transformation of the optical signals their relative intensity (contrast) does not change it is possible to write the equation [F. Perren, Usp. Fiz. Nauk, No 78, 307, 1962]:

$$T_{\text{syst.}}(N) = \prod_{i} (N)$$

(T_i(N) is the contrast-frequency characteristic of the i-th element of the system, N is the spatial frequency). A study was made to determine how fiber-glass affects the contrast-frequency characteristic of the system. The fiber-glass introduces a contrast distortion and violates the above relation. The degree of the distortions depends on the relations of the fiberglass apertures and the other system elements. The conditions most acceptable for measuring the contrast-frequency characteristics of the fiberglass are as follows:

· USSR

DOVGIY, YA. O., et al., Optika i Spektroskopiya Vol XXXIV, No 4, 1973, pp 789-791

illumination by a collimated beam of uniform cross section using any receiving objective or diffuse illumination jointly with a narrow-aperture objective (A $_{\rm ob} \stackrel{<}{\scriptstyle \sim} A_{\rm fiberglass}$).

Frequency-Contrast Characteristics And Noise Of Fiber Optic Cathodoluminescence Screens

Tekhniks kino i televideniya, No 4, Apr 1972, pp 54-55

Abstract: Measurements were made of the frequency-contrast characteristics (FCO) and noise of fiber optic cathodoluminescence acreens during their excitation by a static electron beam. The measurements were made by methods developed for measuring the FCC and noise of cathodoluminescence acreens with a glass substrate. The principal scheme of the device used for measuring FCC is described and a comparison is made of FCC measured by the micrometric method and with electron excitation. The additive contribution of the glass fiber substrate to the noise characteristics of the screen is shown. 3 ill. 4 ref.

"Polarization Shift of the Absorption Edge in α -HgS"

Fiz. elektronika, Resp. mizhvid. nauk.-tekhn. zb. (Physical Electronics, Interdepartmental Scientific-Technical Collection, Ukrainian Republic-collection of works) No. 2, 1970, pp 37-41 (from RZh-Fizika, No. 11, 1971, Abstract No. 11E1171)

Translation: At temperatures of 300 and 80° K, the polarization shift of the natural absorption edge for α -HgS monocrystals cut parallel to the c-axis was measured. On the basis of theoretical and group analysis, a possible variant of the zonal systm of α -HgS is presented and the rules of selection for zone-zones transitions at point Γ of the Brillouin zone are defined. The amount of the polarization shift then corresponds to the energy cap between the valence subzones Γ_4 and $\{\Gamma_5 + \Gamma_6\}$ arising as a result of the spin-orbital interaction. It is expected, from the selection rules, that the optically active absorption band in the infrared abstract

"One Lag Model of the Realization of Capital Investments"

Ekonomika i Mat. Metody [Economics and Mathematical Methods], 1973, 9, No 3, pp 446-450 (Translated from Referativnyy Zhurnal Kibernetika, No 9, 1973, Abstract No 9V308)

Translation: Economic processes related to the realization of capital investments can be described by equations with delay of the form

$$y_t = p_0^x_t + p_1^x_{t-1} + \dots + p_m^x_{t-m}$$

where y_t is the investment of fixed production funds during year t, while x_t are the capital investments during the same year. This article studies the estimation of parameters of these equations using the method of least squares in cases when the coefficients p_k can be represented in the form of first or second power polynomials of k. "Influence of Technology of Attachment of Plates and Repair of Defects on the Fatigue Strength of 16GNMA Steel"

Moscow, Svarochnoye Proizvodstvo, No 10, Oct 70, pp 22-24

Abstract: A study was made to determine the fatigue resistance of boiler steel in connection with the varying technologies of welding of separation elements and correction of defects on the internal walls of the high-parameter drums and boilers. The steel tested had the following chemical composition: 0.17% C, 1.04% Mn, 0.36% Si, 0.05% Cr, 1.1% Ni, 0.47% Mo, 0.16% Cu, 0.05% V, 0.012% P, and 0.013% S. Fatigue resistance was determined using specimens imitating the welding of separator elements and repair of cracks. It was determined that the attachment of plates to 115-mm-thick specimens decreases their fatigue strength by 50% in comparison with smooth specimens. The method of welding the plates (one-sided or two-sided) has no marked effect on fatigue strength. Cracks are easier to locate when two-sided welding is used. Points where cracks 1/2

USSR

KUDRYAVTSEV, I., V., et al, Svarochnoye Proizvodstvo, No 10, Oct 70, pp 22-24

are repaired cause no decrease in fatigue resistance if carefully finished. The fatigue resistance of 50-mm-thick specimens with unrepaired dents is 83% of the endurance limit of smooth specimens. The fatigue resistance of specimens with dents hardened by stamping is close to the fatigue resistance of smooth specimens.
